

Figure 12. Mean absolute coverage of medusahead in paired observations from precision-grazed plots and areas outside the plots (where livestock had continuous access) at two times during 2008 (the year following precision grazing). Means represented by neighboring columns with different letters are significantly different at the 0.05 or 0.01 level when marked with * or **.

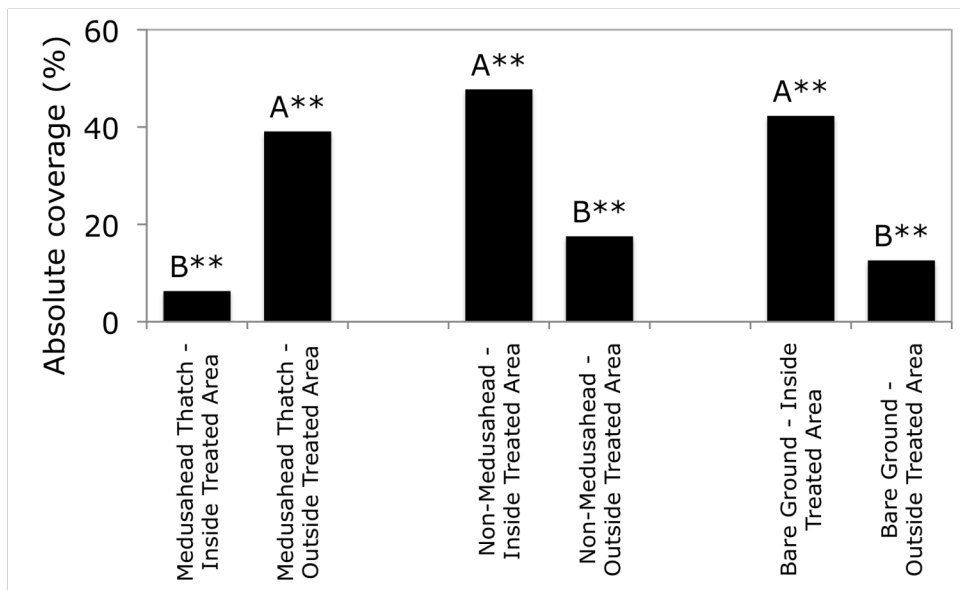

Figure 13. Mean absolute coverage of medusahead thatch, non-medusahead species, and bare ground in paired observations from precision-grazed plots and areas outside the plots (where livestock had continuous access) during March of 2008 (the year following precision grazing).
